

Background

All of the 2017 iGEM teams are invited and encouraged to participate in the Fourth International InterLaboratory Measurement Study in synthetic biology. We're hoping this study will get you excited for iGEM and help prepare you for the summer!

Design

GFP is one of the most used markers in synthetic biology. It gives researchers an access to continuously monitoring the expression level of specific plasmid. However, due to variation in unit, method of data processing, protocol, or instrument, it is hard to repeat measurement in different labs. To solve the problem, we enter interlab study to finish the program by quantifying the experiment with the same protocol.

We use FITC to construct standard measurement curve. Using eight devices from kit plate we get fluorescence curve of them. By comparing those data with blank control, we can find out the expression level of each part.

During Interlab Study, we keep setting of plate reader the same to narrow the variation. Due to lack of black wells with clear bottom, we use black wells with black bottom in fluorescence measurement and clear wells with clear bottom in Abs measurement.

Material

Plasmid used:

- Positive Control (BBa_I20270): (well 20B, Kit Plate 6 and well 21B, Kit Plate 7)
- Negative Control (BBa_R0040): (well 20D, Kit Plate 6 and well 21D, Kit Plate 7)
- Test Device 1 (BBa_J364000): (well 20F, Kit Plate 6 and well 21F, Kit Plate 7)
- Test Device 2 (BBa_J364001): (well 20H, Kit Plate 6 and well 21H, Kit Plate 7)
- Test Device 3 (BBa_J364002): (well 20J, Kit Plate 6 and well 21J, Kit Plate 7)
- Test Device 4 (BBa_J364003): (well 20L, Kit Plate 6 and well 21L, Kit Plate 7)
- Test Device 5 (BBa_J364004): (well 20N, Kit Plate 6 and well 21N, Kit Plate 7)
- Test Device 6 (BBa_J364005): (well 20P, Kit Plate 6 and well 21P, Kit Plate 7)

Protocols

>>Calibration

>>Cell measurement

Description

Positive control, negative control and devices 2~6 are all taken up from 2017 DNA distribution kit plate 7 and device1 is taken from plate 6 because we failed to transform it using plasmids in plate 7. After checking the results under UV light, we chose 2 colonies for each device and grew them in 5ml LB for 16h. Then OD was measured and recorded in order to calculate the volume of bacteria liquid to be added to make the final OD around 0.02 before the following incubation.

We incubated the DH5 α for 6 hours, and we took 100 μ l bacteria liquid for measurement every other hour. OD and fluorescence were both measured by Tecan Genios. However, the measurement of OD used clear plate while the measurement of fluorescence used black plate. This is because we were not able to get the black clear plate. And we are trying to connect HQ to express this problem.
