

Protocol for Adenovirus Infection in Mouse Primary Hepatocytes

1. Replace cell culture plate with DMEM medium with 0.1% FBS at 2h.
2. Add 30 μ L adenovirus introduced in each well 2 hours later.
3. After 12 hours' infection, change the medium to the glucose-free DMEM medium with 10%FBS, add glucagon as stimulation.
4. Incubate cells for 24 hours under proper condition of 37°C, 5% CO₂.
5. Withdraw cells for continuous experiments.
