## Sequencing analysis :

- V26 : Not 100% coverage of the insert, but the sequenced regions are correct
- V27 : Only clone #9 positive. Take it and resequence only with pcDNA3\_new
- V28 : All positive, take #1.
- V4 : the maxi seems to be okay
- V5 : Re-sequene with pCAG\_fw

## Sequencing results :

- The Sequencing files of the following plasmids were re-checked to see if the used constructs were all okay :
  - V8-V11, V14, V29,V30 -> they were all okay
  - V15#2 is a positive clone. 150ml LB Med + Amp were inoculated with this clone, but unfortunately the agar plate used was half way dried out. The Maxi Prep will need Sequencing verification.
