Bioengineering

Internet

A biological system can be understood as a complex node network united by intricate connections at multiple scales

There is a wide
fundamental knowledge

Specific **relations** between the **external** manifestations
of the system and its **internal state**

Specific **relations** between the **external** manifestations
of the system and its **internal** state

Specific **relations** between the **external** manifestations
of the system and its **internal** state

Specific **relations** between the **external manifestations**
of the system and its **internal state**

There are techniques to detect nodes

There are techniques to detect nodes

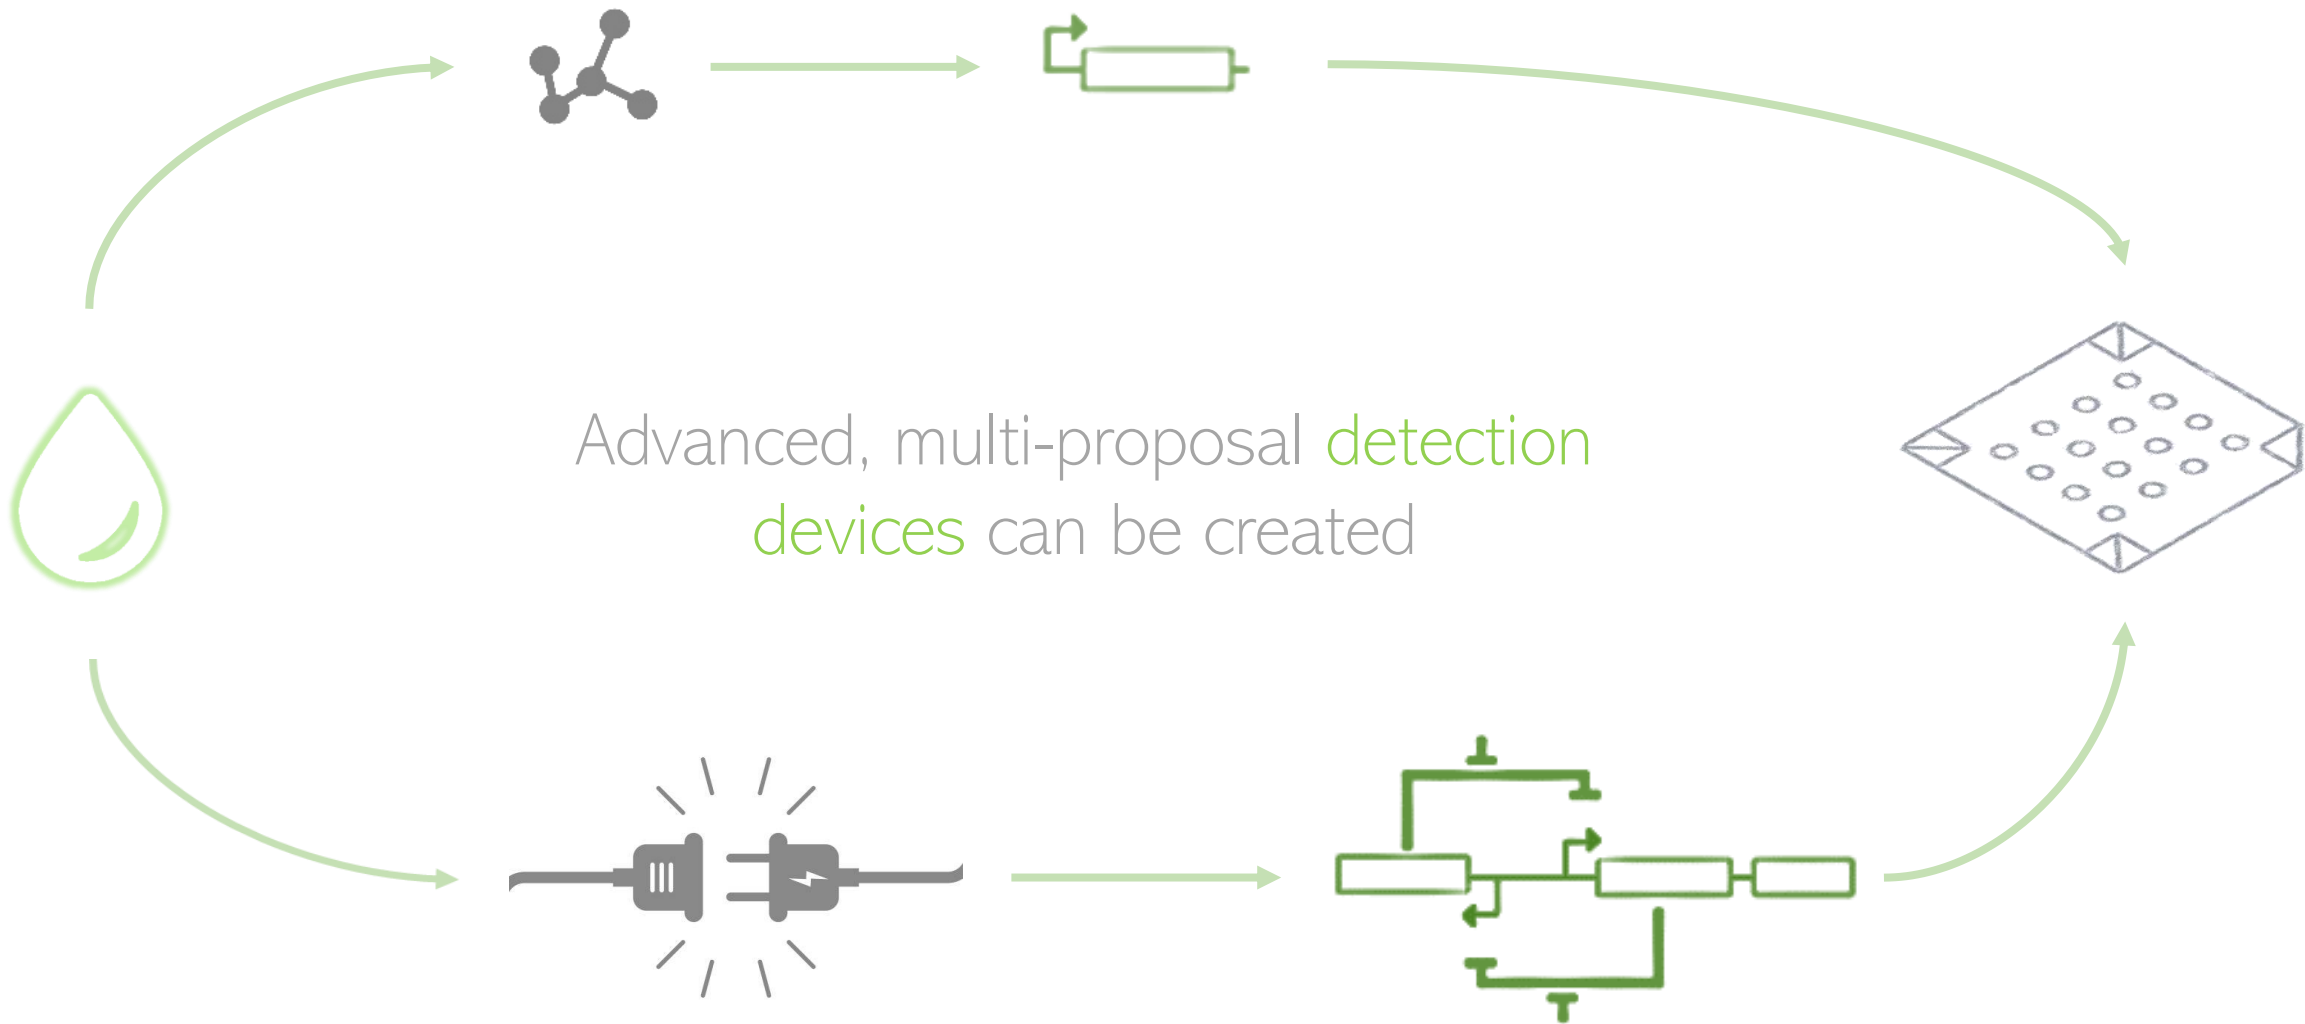

There are techniques to detect nodes

There are techniques to detect their interactions

Advanced, multi-proposal **detection**
devices can be created

Liquid biopsies are becoming more efficient and powerful, and less invasive

The spread of smart and connected devices creates
an infinite range of possibilities

The spread of smart and connected devices creates
an infinite range of possibilities

The spread of smart and connected devices creates
an infinite range of possibilities

The spread of smart and connected devices creates
an infinite range of possibilities

It is possible to [integrate](#), [analyze](#) and [send](#) information from almost [any place or situation](#), and increasingly [fast](#)

Internet allows massive sets of interconnected devices to act as powerful computing architectures

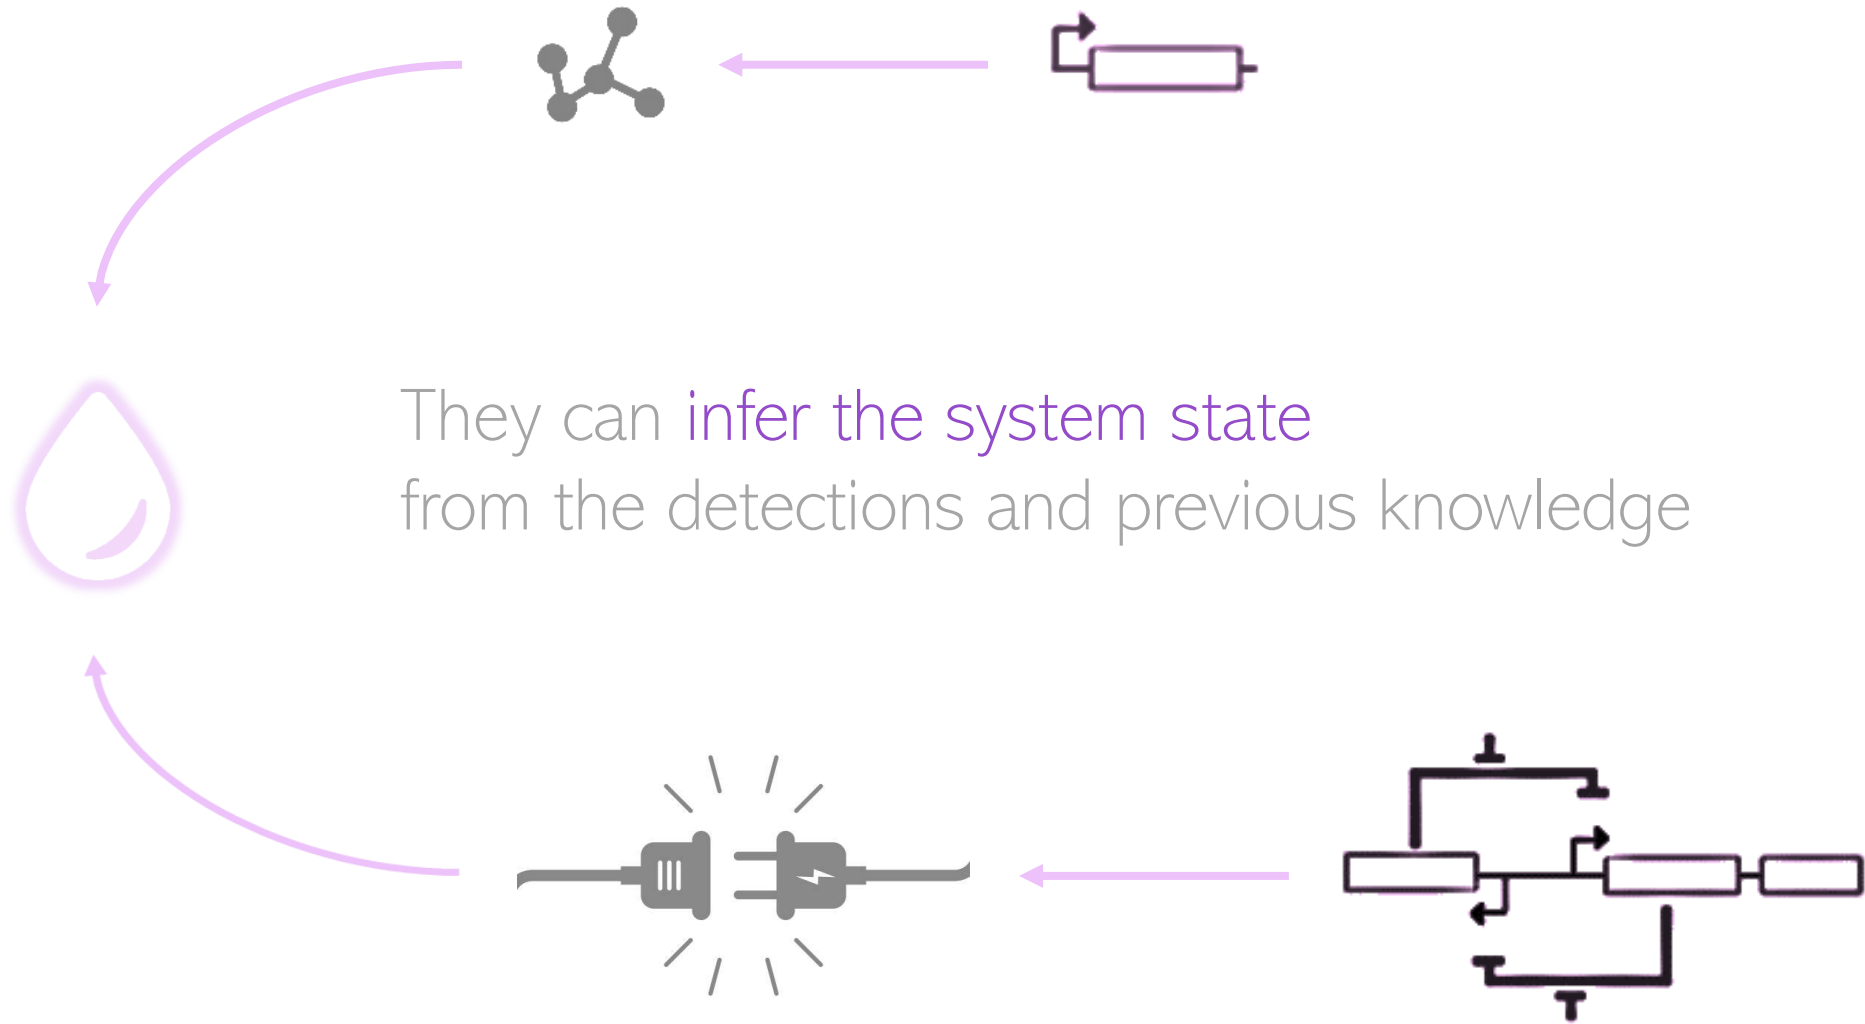

The great advances in hardware and software have supported a huge development in the field of Artificial Intelligence

Deep Neural Network systems have demonstrated their amazing potential

With enough training, they can recognize subtle patterns to solve difficult tasks

Recognizing **nuances**
that were invisible before

Thanks to the [Internet](#)

Systems can **serve** wherever it is needed

Providing the **key information**
to clinicians

To fight complex diseases
more efficiently

Non-supervised Learning systems are the perfect expansion tool

They can define new interesting patterns using raw data, which could then be used to train more neural networks

The goal is an architecture that becomes more
efficient and powerful with time

Artificial Neural Networks

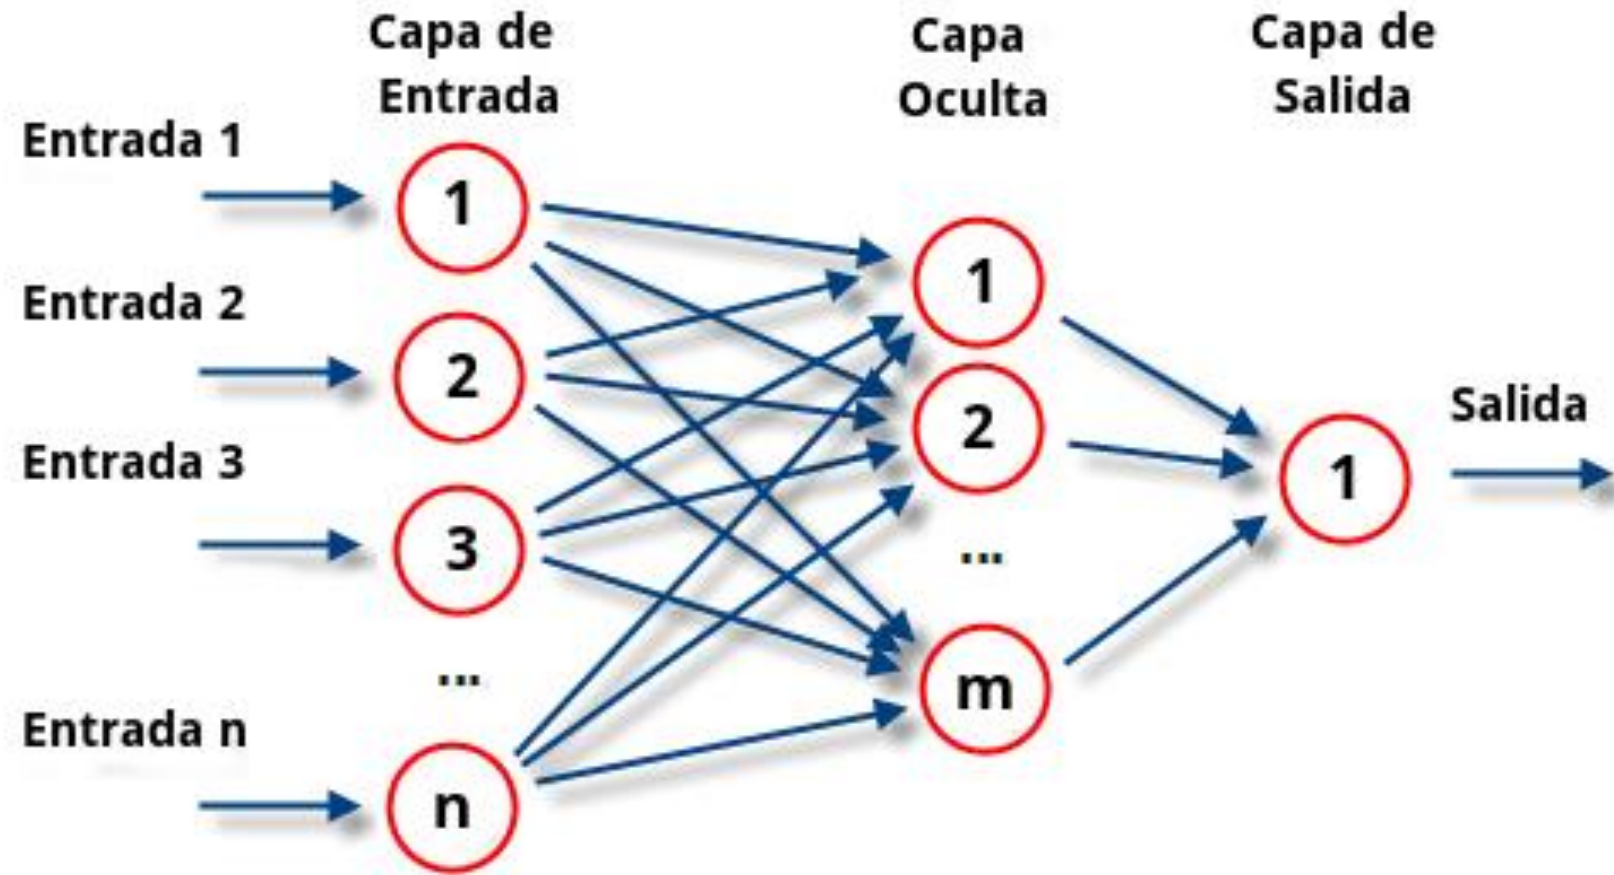

What are they?

Machine learning is a branch of artificial intelligence that allows machines to learn, with respect to a particular task, without being explicitly programmed to do so.

CRISPR-Cas ?

CRISPR-Cas ?

CRISPR-Cas ?

CRISPR-Cas

Khorana, Nirenberg, Matthaei, and Ochoa identify which codon sequences indicate each of the 20 amino acids, thereby **"cracking the genetic code"** and enabling advances in genetic engineering.

1966

Shapiro and Beckwith **isolate the first gene**.

1969

Paul Berg creates the first **recombinant DNA molecules**.

1972

Fred **Sanger** invents a method for **sequencing DNA**, which later enables researchers to map genomes.

1977

1967

The first **DNA ligase** is isolated.

1970

The first **restriction enzyme** is isolated.

1973

Cohen and Boyer create first **recombinant DNA organisms**.

Before CRISPR-Cas...

TATTGCATGCCGAT
ATAACGTACGGCTA

A vertical oval highlights the mismatch between the two DNA sequences at the 8th position. The top sequence is TATTGCATGCCGAT and the bottom sequence is ATAACGTACGGCTA. The 'C' in the top sequence and the 'G' in the bottom sequence are highlighted in orange, and a vertical oval is drawn around them to indicate the mismatch.
