# 1 Colony picking

**Estimated bench time:** 10 minutes per plate

**Estimated total time:** 10 minutes per plate

**Purpose:** Picking single colonies for further processing

## 1.1 Materials

- Autoclaved Eppendorf tubes
- Autoclaved H<sub>2</sub>O
- Bunsen Burner
- Pipettes & tips
- Plates with the bacterial colonies

## 1.2 Setup & protocol

- Fill out Eppendorf tubes with 15 µL autoclaved H<sub>2</sub>O.
- Pick bacterial colonies ( $\pm 5$  per plate) near the Bunsen flame with a pipette tip.
- Place the colonies into correct labeled Eppendorf tubes.
- Pipette up and down such that they are mixed well.

## 2 Colony PCR

**Estimated bench time:** 30 minutes

**Estimated total time:** 10 minutes per plate

**Purpose:** Verifying if the colony contains the correct insert.

When performing a colony PCR, you are working with bacteria close to a Bunsen Burner. Make sure to disinfect your hands. When preparing the MasterMix, make sure to use gloves to protect the MasterMix from DNase activity.

### 2.1 Materials

- 2X KAPA2G mix
- Autoclaved H<sub>2</sub>O
- Bucket with ice
- Pair of primers that correspond to correct binding sites on the vector
- PCR tubes
- Pipettes and tips
- Colonies from colony picking
- Thermal cycler

### 2.2 Setup & protocol

For one colony PCR reaction, the following mix should be made:

Component	Quantity/mass/final concentration	Volume (uL)
<b>DNA from bacteria</b>	Pipette tip in 15uL H <sub>2</sub> O	1 for each separate PCR mixture
<b>2X KAPA2G mix</b>	1x	12.5
<b>Primer FW</b>	0.5 $\mu$ M (stock: 10 $\mu$ M)	1.25
<b>Primer REV</b>	0.5 $\mu$ M (stock: 10 $\mu$ M)	1.25
<b>H<sub>2</sub>O</b>		9
<b>Total</b>		25

In order to simplify this step, prepare a MasterMix (2-3 reactions in excess). Keep the mix on ice. Do not add the bacterial DNA but take it into account while calculating the amount of required H<sub>2</sub>O.

Component	Quantity/mass/final concentration	Volume (uL)
<b>DNA from bacteria</b>	Pipette tip in 15uL H <sub>2</sub> O	1 for each separate PCR mixture
<b>2X KAPA2G mix</b>	1x	
<b>Primer FW</b>	0.5 $\mu$ M (stock: 10 $\mu$ M)	
<b>Primer REV</b>	0.5 $\mu$ M (stock: 10 $\mu$ M)	
<b>H<sub>2</sub>O</b>		
<b>Total</b>		

Run the following PCR program:

Step	Temp (° C)	Time (s)	Cycles
<b>Initial denaturation</b>	95	180	1
<b>Denaturation</b>	95	15	35
<b>Annealing</b>	58	15	
<b>Extension</b>	72	20 s/kb	
<b>Final extension</b>	72	600	1
<b>Cooling</b>	4	Hold	1

### 3 Gel electrophoresis

**Estimated bench time:** 40 minutes

**Estimated total time:** 1.5 hours

**Purpose:** Agarose gel electrophoresis may be used to verify the purity of your PCR product. If the product is pure, a single band will show up during the gel electrophoresis.
